

Data leak worksheet

Incident summary: A sales manager shared access to a folder of internal-only documents with their team during a meeting. The folder contained files associated with a new product that has not been publicly announced. It also included customer analytics and promotional materials. After the meeting, the manager did not revoke access to the internal folder, but warned the team to wait for approval before sharing the promotional materials with others.

During a video call with a business partner, a member of the sales team forgot the warning from their manager. The sales representative intended to share a link to the promotional materials so that the business partner could circulate the materials to their customers. However, the sales representative accidentally shared a link to the internal folder instead. Later, the business partner posted the link on their company's social media page assuming that it was the promotional materials.

Control	Least privilege
Issue(s)	<p><i>What factors contributed to the information leak?</i></p> <p><i>The main factor that led to this leak was that the manager didn't revoke the access of the folder even when the work was complete and the information got in too many hands leading to the leak.</i></p> <p><i>This also broke the principle of least privilege as the employee was not supposed to have access to that internal folder and they ignored the manager's warning. Also business partners shouldn't be allowed to share promotional material on social media.</i></p>
Review	<p><i>What does NIST SP 800-53: AC-6 address?</i></p> <p><i>It addresses how the access should be given. It states that only a minimal (least) amount of access should be given that is required to complete a certain job. The intention is to prevent a user from operating at privilege</i></p>

	levels higher than what is necessary to accomplish business objectives.
Recommendation(s)	<p><i>How might the principle of least privilege be improved at the company?</i></p> <p><i>The principle of least privilege can be improved by adding an auto revoke functionality which automatically revokes access back from employees once they are done with the concerned task.</i></p> <p><i>Also they should keep logs of access like who accessed the data, when it was accessed and who currently has access to the data.</i></p>
Justification	<p><i>How might these improvements address the issues?</i></p> <p><i>These improvements will make sure that the sensitive data is safe from unauthorized access and to make sure that only intended personals can access the data.</i></p>

Security plan snapshot

The NIST Cybersecurity Framework (CSF) uses a hierarchical, tree-like structure to organize information. From left to right, it describes a broad security function, then becomes more specific as it branches out to a category, subcategory, and individual security controls.

Function	Category	Subcategory	Reference(s)
Protect	PR.DS: <i>Data security</i>	PR.DS-5: <i>Protections against data leaks.</i>	NIST SP 800-53: AC-6

In this example, the implemented controls that are used by the manufacturer to protect against data leaks are defined in NIST SP 800-53—a set of guidelines for securing the privacy of information systems.

Note: References are commonly hyperlinked to the guidelines or regulations they relate to. This makes it easy to learn more about how a particular control should be implemented. It's common to find multiple links to different sources in the references columns.

NIST SP 800-53: AC-6

NIST developed SP 800-53 to provide businesses with a customizable information privacy plan. It's a comprehensive resource that describes a wide range of control categories. Each control provides a few key pieces of information:

- **Control:** A definition of the security control.
- **Discussion:** A description of how the control should be implemented.
- **Control enhancements:** A list of suggestions to improve the effectiveness of the control.

AC-6	Least Privilege
	<p>Control:</p> <p>Only the minimal access and authorization required to complete a task or function should be provided to users.</p>
	<p>Discussion:</p> <p>Processes, user accounts, and roles should be enforced as necessary to achieve least privilege. The intention is to prevent a user from operating at privilege levels higher than what is necessary to accomplish business objectives.</p>
	<p>Control enhancements:</p> <ul style="list-style-type: none">● Restrict access to sensitive resources based on user role.● Automatically revoke access to information after a period of time.● Keep activity logs of provisioned user accounts.● Regularly audit user privileges.

Note: In the category of access controls, SP 800-53 lists least privilege sixth, i.e. AC-6.
